

# COMPANION TOOLS

## TWO FACTOR AUTHENTICATION

*ADD AN EXTRA LAYER OF SECURITY TO YOUR TSPLUS WEB PORTAL!*

*(Only with MOBILE WEB and ENTERPRISE, included as a 30-DAY TRIAL, 30 USERS!)*

TSplus 2FA allows you to use your mobile device to access your remote session securely and conveniently.

Relying on just usernames and passwords to secure your online accounts is no longer considered safe.

Your employees are using TSplus to work from home, using their own devices to share personal and corporate data online, and then using those same devices for social media and other less secure communications and transmissions.

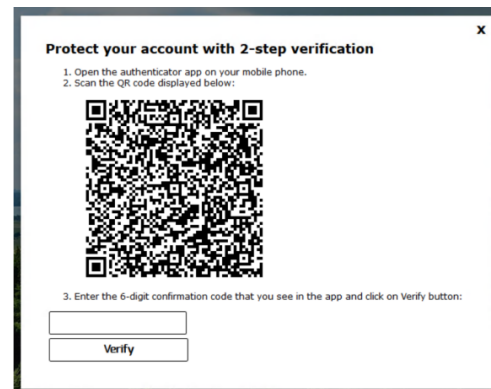

If you're an admin responsible for cybersecurity in a large organization, **you need to respond to this increased threat with efficient methods.**

All it takes is one weak link in the chain, one impatient or exhausted employee, to leave your organization vulnerable to attack.

**TSplus 2FA is your key to a secure world.**

By providing dynamic passcodes and multi-factor authentication, this add-on is the identity and access tool you need to secure your corporate network or your own personal data.

TSplus 2FA prerequisites on the user side:

- A personal portable device, such as a Smartphone.
- An authenticator app installed on this device. The following apps can be used to proceed:
  - [Authy](#)
  - [Google Authenticator](#)
  - [Microsoft Authenticator](#)

# COMPANION TOOLS

## ✓ Easy To Install and Use

Totally driverless

Just Enable TSplus 2FA and add the users and groups you wish to use this method connect to your Web Applications Portal.

It is a two steps verification process:

- **One:** At the first connection to the Web Portal, users will need to enter their phone number or scan a QR code to configure the authentication method (SMS or App) and authenticate his device.
- **Two:** At every future connection, users will need two pieces of information: their credentials and the authentication code automatically generated on their mobile device.

## ✓ Easy To Configure and Manage

Complete dashboard and many options

In the 2FA tab of the AdminTool, the Administrator can handle all credentials resets in just a few clicks.

You can easily configure users, choose the verification method (per user), manage SMS settings and test the feature directly. **It is simple, flexible and powerful!**

## ✓ Extra Layer of Security

Drastically reduce the risk of hacks!

Build strong and frictionless passwords **for your TSplus Web Application Portal.**

With a single touch, users can generate dynamic and one-time number combinations (the verification codes are generally reset every 30 seconds) to supplement static usernames and passwords for added security.

So even if the passwords are acquired, they cannot be reused or sold.

## ✓ Available Offline & Multiplatform

Accessible on Multiple Devices

Get two-factor authentication on your device **without any extra hardware.**

Users can authenticate using generated passwords on their device even when those devices are offline. Picking between SMS or Authenticator App allows compatibility with any mobile OS!

*TSplus 2FA license is valid per server!!*
